2014 Hospital Infections Disclosure Act Annual Report to the General Assembly

This 2014 Report on the progress of implementing the South Carolina Hospital Infection Disclosure Act (HIDA) is being submitted in compliance with the S.C. Code Section 44-7-2440 requirement of submitting an annual progress report.

Acknowledgements: The South Carolina Department of Health and Environmental Control (DHEC) gratefully acknowledges that the HIDA achievements were made possible by the combined efforts of DHEC staff and hospital infection prevention staff, the active participation of the HIDA Advisory Committee and subcommittees, and the effective partnership established with the Association for Professionals in Infection Control (APIC-Palmetto), the South Carolina Hospital Association (SCHA), and the South Carolina Revenue and Fiscal Affairs Office (RFA).

Executive Summary

Healthcare-associated infections (HAIs) are infections that patients acquire as a result of receiving healthcare for other conditions. In an effort to address HAIs and promote healthcare transparency in South Carolina, the South Carolina Department of Health and Environmental Control (DHEC), with the advice of an advisory committee, began work in September 2006 to mandate the HAI reporting law known as the Hospital Infections Disclosure Act (HIDA). This law provides HAI data from acute care, long term acute care and inpatient rehabilitation facilities to the public and therefore, promotes infection prevention activities within healthcare facilities to improve patient safety.

The 2014 HIDA Annual Report is the 7th annual report on South Carolina HAI data. This report contains data from January 2014 to December 2014 for the following infections:

- **Central Line-Associated Bloodstream Infections (CLABSI) data for the following inpatient locations:**
 - Adult and Pediatric Critical Care Locations
 - Adult and Pediatric Ward Locations
 - Adult and Pediatric Specialty Care Area Locations (i.e., hematology/oncology, bone marrow transplant, leukemia/lymphoma units)
 - Long Term Acute Care (LTAC) Critical Care Locations
 - Long Term Acute Care (LTAC) Ward Locations
 - Rehabilitation Ward Locations
- **Surgical Site Infections (SSIs) and related data for the following surgical procedure categories in acute care hospitals licensed by DHEC:**
 - Colon surgeries (COLO)
 - Hip arthroplasties (HPRO)
 - Knee arthroplasties (KPRO)
 - Abdominal hysterectomies (HYST)
 - Coronary artery bypass grafts, chest incision only (CBGC)
 - Coronary artery bypass grafts, chest and donor incisions (CBGB)
- **Laboratory identified (LabID) events for:**
 - Methicillin-resistant *Staphylococcus aureus* (MRSA) bloodstream infections (BSI)

In 2014, 79 South Carolina healthcare facilities reported data on the above healthcare-associated infections to the National Healthcare Safety Network (NHSN) and conferred rights to this data to the South Carolina Department of Health and Environmental Control.

- The overall CLABSI standardized infection ratio (SIR) for reportable locations in South Carolina was 0.49. The overall South Carolina CLABSI SIR was statistically significantly lower compared to national baseline data.
- The overall SSI complex admission readmission (AR) SIR for reportable procedures in South Carolina was 0.79. The overall South Carolina SSI complex AR SIR was statistically significantly lower compared to national baseline data.
- The overall hospital-onset (HO) MRSA BSI LabID event SIR for acute care facilities in South Carolina was 0.99. The overall South Carolina HO MRSA BSI LabID event SIR for acute care facilities was not statistically different compared to national baseline data.

Introduction

Healthcare-associated infections (HAIs) are a major public health problem. A point prevalence survey conducted by The Centers for Disease Control and Prevention (CDC) using 2011 HAI data estimated that 722,000 HAIs occurred each year in U.S. acute care hospitals, contributing to about 75,000 patient deaths during hospitalization. Roughly 1 in every 25 patients develops at least one HAI, and more than half of all HAIs occur outside of intensive care units (Magill SS, 2014). Healthcare-associated infections are also a financial burden, causing healthcare facilities in the United States to absorb between \$28 to \$48 billion dollars in additional costs each year (US Department of Health and Human Services, 2010).

Increased public awareness and understanding that healthcare-associated infections are preventable has prompted consumers and policy makers to take action. In 2006, South Carolina lawmakers passed the Hospital Infections Disclosure Act (HIDA) with the goal to provide fair, accurate, and comparable information about hospital infection rates to consumers. HIDA was an important step toward promoting HAI prevention and measuring the progress toward the elimination of HAIs in South Carolina.

With the passing of the HIDA law, the South Carolina Department of Health and Environmental Control (DHEC) established a multidisciplinary advisory panel to study and make recommendations for the surveillance and reporting of HAIs. The panel is comprised of healthcare consumer advocates, infection preventionists, hospital leaders, physicians, and DHEC representatives. A current list of HIDA advisory committee members is available in appendix A.

HIDA Advisory Committee Recommendations for Reporting Requirements and Public Reports

Using the Centers for Disease Control and Prevention's (CDC)/NHSN HAI surveillance definitions, the advisory panel recommends that all acute care, long term acute care, and inpatient rehabilitation hospitals licensed by DHEC report central-line associated blood stream infections (CLABSI), surgical site infections (SSI) associated with specific high-volume and high-risk surgical procedures and specific multidrug resistant organisms. The HIDA law allows for flexibility in reporting requirements, allowing requirements to be phased in and out on an as-needed basis, at the recommendation of the HIDA advisory committee. The complete HIDA statute can be found on the DHEC HAI webpage at: <http://www.scdhec.gov/Health/FindingQualityHealthcare/CompareHospitalInfectionRates/LawsRegulations/>.

The HIDA Annual Report is published every April 15 and contains the previous calendar year's data, including facility specific HAI reports. Facility specific HIDA interim reports are also published each October 15, containing data from the first six months of the year. All reports are made available to the public on the DHEC HAI website, to assist consumers in making informed choices about their own healthcare, as well as incentivize facilities to reduce their infection rates by improving patient safety and reduce the costs associated with HAIs.

2014 HIDA Reporting Requirements

A. Central Line-associated Blood Stream Infections (CLABSI) within the following inpatient location types:

- Adult Critical Care Locations
- Pediatric Critical Care Locations
- Neonatal Critical Care Locations – levels II/III, III
- Adult Ward Locations
- Pediatric Ward Locations
- Adult Hematology/Oncology Locations
- Pediatric Hematology/Oncology Locations
- Long Term Acute Care Locations
- Inpatient Rehabilitation Locations

B. Surgical Site Infections (SSI) for the following procedure types:

- Colon surgeries
- Hip arthroplasties
- Knee arthroplasties
- Abdominal hysterectomies
- Coronary artery bypass grafts (with and without donor site incision)

C. Laboratory Identified Multi Drug-resistant Organism infections including:

- Methicillin-resistant *Staphylococcus aureus* (MRSA) blood stream infections (BSI)
- Carbapenem-resistant *Enterobacteriaceae* (CRE) infections, specifically *Escherichia coli* and *Klebsiella* species¹

D. Healthcare worker influenza vaccination summary data²

¹Carbapenem-resistant *Enterobacteriaceae* (CRE) infection surveillance is in implementation and reported data are currently undergoing validation. Therefore, CRE infection data is not published in this report.

²Healthcare worker influenza vaccination summary data for the 2014/2015 influenza season will be published on October 15, 2015.

Methods

This report contains self-reported data from 79 South Carolina healthcare facilities and contains information about infections that occurred from January 2014 through December 2014. The data were downloaded from NHSN on April 1, 2015. Any changes or updates to the data after this date will not be reflected in this report.

National Healthcare Safety Network (NHSN)

All data were reported through the NHSN database, a secure, internet-based surveillance system that is maintained by the Division of Healthcare Quality Promotion (DHQP) at CDC. To fulfill HIDA reporting requirements for the 2014 reporting period, 79 South Carolina healthcare facilities conferred access rights to DHEC through NHSN. To fulfill HIDA reporting requirements, hospitals must follow NHSN reporting definitions and procedures for all reportable HAIs.

In addition to HIDA reporting, South Carolina healthcare facilities also report into NHSN to fulfill the requirements of the Centers for Medicare and Medicaid Services (CMS) Hospital Inpatient Quality Reporting Program. These data are posted for public reporting on the Department of Health and Human Services (DHHS) Hospital Compare Website available at:

<http://www.medicare.gov/hospitalcompare/search.html>. It is important to note that the data presented on the CMS Hospital Compare website may differ from South Carolina HIDA data reports as the reporting requirements and data submission deadlines are different for CMS compared to HIDA.

Data Quality Assurance

Reporting hospitals are responsible for ensuring that the data they submit has been consistently and accurately reported in accordance with NHSN protocols. In addition, NHSN and DHEC have implemented regular data checks to identify data quality and completeness issues that require reconciliation by the reporting hospital. Prior to publication, hospitals have several opportunities to review and correct reporting lapses and/or discrepancies in their data.

NHSN examples of data quality assurance:

- The NHSN system has internal data logic checks built into the web interface that helps reduce data entry error. These checks are designed to reduce manual data entry errors and improve the validity of data entered into the system.
- The NHSN Action List is another tool that is built into the NHSN system that improves data completeness and accuracy. The list shows hospital users whether they have any missing or incomplete records entered into the system and requires user action in order to resolve the issues.

DHEC examples of data quality assurance:

- Biannually, prior to the publication of the HIDA annual and interim facility specific reports, all reporting facilities are provided with preliminary reports showing the number of CLABSI, SSI and MRSA LabID Event data records that were downloaded from NHSN for the given reporting period. Facilities are asked to compare their preliminary reports to their internal HAI record numbers to determine if all records were entered into NHSN

- Hospitals are given approximately two weeks to review their facility specific preliminary reports and to make necessary changes in their reported data within NHSN. All hospitals are expected to sign a standard attestation letter of data completeness and accuracy and submit the document to DHEC prior to the publication of the HIDA annual and interim reports. An example of submitted attestation of data completeness and accuracy letter can be found in appendix B.
- Additionally, DHEC performs on-site validation audits at a sample of facilities annually. In 2015, DHEC will perform on-site validation audits at a sample of facilities that reported data during the January 1, 2014 – December 31, 2014 reporting period. CDC NHSN validation guidelines for facility selection and medical record abstraction will be utilized and adapted to meet the needs of HIDA.

2014 HIDA Reporting Schedule and Data Deadlines

DHEC downloads data from NHSN for public reporting biannually – once for the HIDA interim report and once for the HIDA annual report. The facility specific HIDA interim reports were published on October 15, 2014 and contain facility specific data from the first six months of the year. This HIDA annual report will be published April 15, 2015 and contains statewide and facility specific data for the 2014 calendar year.

In 2014-2015, DHEC notified HIDA reporting facilities through email of strict data submission deadlines and reconciliation deadlines. Facility specific HIDA interim reports and annual reports are published on October 15 and April 15, respectively, on the DHEC HAI website:

<http://www.scdhec.gov/Health/FHPP/InfectionControlHIDA/HospitalInfectionControl/#current>.

Standardized Infection Ratio (SIR) and 95% Confidence Interval Calculations

The standardized infection ratio (SIR) is an indirect standardization method of summarizing the HAI experience across any number of stratified groups of data (e.g., healthcare facilities or unit types). The SIR metric can be used to assess HAIs at the national, state, or facility level and adjusts for patients of varying risk within each facility. The SIR is used to compare South Carolina hospitals' HAI incidence to national baseline HAI data, adjusting for several risk factors shown to be significantly associated with difference in infection incidence (Edwards J, 2009). In this annual report, the SIR metric will be presented for CLABSI, SSI, and MRSA LabID Event data.

The SIR is derived by dividing the total number of observed HAI by the total number of expected HAI based on national benchmark data.

$$\text{SIR} = \frac{\text{Observed HAI}}{\text{Expected HAI}}$$

Interpreting the SIR:

- A SIR of 1.0 means the observed number of HAIs is equal to the number of expected infections.
- A SIR that is greater than 1.0 means more infections were observed than expected.
- A SIR that is less than 1.0 means that fewer infections were observed than expected.

Calculating SIRs for Central Line Associated Blood Stream Infections (CLABSI):

The CLABSI SIR is derived by dividing the total number of observed CLABSI events by the total number of expected CLABSI events based on national benchmark data. To calculate the number of “expected” CLABSI for a particular unit type, one must multiply the national CLABSI rate associated with the unit type by the number of central line days observed in the unit for a given time period. The CLABSI SIR for the particular unit is then calculated by dividing the number of observed CLABSI by the number of expected CLABSI.

To demonstrate how a CLABSI SIR is calculated for a particular unit type, an example is provided below:

	Observed		National Benchmark Data
Location Type	# CLABSI	# Central Line (CL) Days	CLABSI Rate
Medical Cardiac Unit	2	578	2 per 1,000 central line days

The formula for calculating the “expected” number of CLABSI for the Medical Cardiac Unit is:

$$\text{Expected CLABSI} = (\text{Observed CL Days}) \times (\text{National CLABSI Rate}) = (578 \text{ CL days}) \times (2.0 \text{ CLABSI} / 1,000 \text{ CL days}) = 1.156$$

The formula for calculating the SIR for Medical Cardiac Unit is:

$$\text{SIR} = (\text{Observed CLABSI}) / (\text{Expected CLABSI}) = (2) / (1.156) = 1.7$$

CLABSI data from multiple locations can be “rolled up” into a single risk-adjusted SIR by summing the total number of CLABSIs observed across the locations and then dividing that number by the total number of CLABSIs expected for the locations.

Calculating SIRs for Surgical Site Infections (SSIs):

The SSI SIR is derived by dividing the total number of observed SSI events by the total number of expected SSI. Logistic regression models are used to determine how one or more independent variables (such as the American Society of Anesthesiologists (ASA) classification score and surgery duration) are related to the risk or probability of developing an infection. The logistic regression models are procedure specific, allowing for risk adjustment to occur based on the risk factors of both the patient and the procedure type. To determine the total number of expected infections for a procedure type, the risks of infection for each procedure performed at the facility, during a specific time period, are summed.

Calculating SIRs for Facility-wide Inpatient Hospital-onset Methicillin-resistant Staphylococcus aureus Blood Stream Infection (HO MRSA BSI) LabID Events:

The facility-wide inpatient HO MRSA BSI LabID event SIR is derived by dividing the total number of observed HO MRSA BSI LabID events at a hospital by the total number of expected HO MRSA BSI LabID events for the hospital. Logistic regression models are used to calculate the number of expected HO MRSA BSI LabID events for a hospital by adjusting for one or more independent variables (such as a hospital’s total number of patient days, community-onset MRSA prevalence rate and medical school affiliation) that are related to the risk or probability of HO MRSA BSI LabID events.

For each SIR, a 95% confidence interval was calculated. A confidence interval is a range of values that quantifies the random variation of a ratio. The wider the confidence interval, the greater the uncertainty associated with the ratio. The width of the confidence interval is in part related to the size of expected HAI occurrence. Smaller facilities with fewer predicated HAIs have the least precision associated with their SIRs and thus the widest confidence intervals. For the summary tables the 95% confidence interval was calculated by NHSN. However, NHSN does not calculate a SIR and confidence interval when the number of expected infections is less than one. Thus, for the facility specific comparison tables the SIR and 95% confidence interval was calculated using the Poisson distribution.

Statistical Interpretation of SIR 95% Confidence Intervals:

- A confidence interval range that is less than 1 (e.g., 0.5 – 0.75) indicates a statistically significant SIR that is lower compared to the standard population.
- A confidence interval range that is greater than 1 (e.g., 1.25 – 1.50) indicates a statistically significant SIR that is higher compared to the standard population.
- A confidence interval range that includes 1 (e.g., 0.75 – 1.25) indicates a SIR that is not statistically significant and is not different compared to a standard population.

Eligible Data

The 2014 HIDA Annual Report contains data for calendar year 2014 that was reported to DHEC through NHSN by HIDA reporting hospitals.

Facility specific rate reports are available for all reporting facilities and include CLABSI rates by all reportable location types, SSI rates by reportable procedure types and risk indexes, and incidence density rates for HO MRSA BSI LabID events. Facility specific rate reports are located in appendix C.

Facility specific comparison CLABSI SIR reports are available for the following inpatient location types: adult critical care locations, adult ward locations, pediatric critical care locations, pediatric ward locations, adult hematology/oncology locations, pediatric hematology/oncology locations, bone marrow transplant locations. Some locations are excluded from the location type CLABSI SIR reports due to lack of national benchmark data. A complete list of CLABSI reporting locations and available benchmark data status is located in appendix D.

Facility specific comparison SSI SIR reports are available for the following procedure types: coronary artery bypass graft (chest incision only), coronary artery bypass graft (chest and donor incisions), hip prosthesis, knee prosthesis, abdominal hysterectomy, and colon surgery. The SSI SIR presented in comparison reports and statewide SSI SIR data is the complex admission readmission (AR) SIR. The complex AR SIR includes only inpatient procedures and Deep Incision Primary and Organ/Space SSIs identified during admission or readmission to the facility where the procedure was performed.

Facility specific comparison hospital onset MRSA BSI LabID event SIR reports are available for acute care facilities. National MRSA BSI LabID event benchmark data are used to calculate SIRs for long term acute care and inpatient rehabilitation hospitals are currently unavailable.

Facility specific comparison reports for CLABSI, SSI and HO MRSA BSI LabID events are located in appendices E1 through E3.

Results

The data presented in this report were self-reported from healthcare facilities in South Carolina, from January 1, 2014 – December 31, 2014, in compliance with HIDA.

Reporting Facility Information

Seventy-nine facilities of varying types were required to report HAI data to DHEC via NHSN in 2014. The majority of HIDA reporting hospitals were acute care hospitals, comprised of 58 general hospitals, 5 critical access hospitals, 1 children's hospital, 1 women's and children's hospital and 1 surgical hospital. Six long term acute care hospitals and 7 inpatient rehabilitation hospitals also reported data. A summary of HIDA reporting facility types is shown in Table 1.

Table 1. Summary of HIDA Reporting Hospital Types		
Facility Type	N	Percent (%) of HIDA Reporting Facilities
Acute Care Hospital (General)	58	74%
Acute Care Hospital (Critical Access)	5	6%
Acute Care Hospital (Surgical)	1	1%
Acute Care Hospital (Women's and Children's)	1	1%
Acute Care Hospital (Children's)	1	1%
Inpatient Rehabilitation Hospital	7	9%
Long Term Acute Care Hospital	6	8%
Total Hospitals	79	100%

Table 2 displays the frequency of acute care hospitals with affiliation to a medical school. The majority (73%) of reporting hospitals reported no affiliation with a medical school.

Table 2. Frequency of HIDA Reporting Hospital Medical School Affiliation		
Medical School Affiliation	No. Hospitals	Percentage (%) of Reporting Acute Care and LTAC Hospitals
Medical School Affiliation	16	27%
<i>Major</i>	6	--
<i>Graduate</i>	7	--
<i>Undergraduate</i>	3	--
No affiliation	43	73%
Missing ¹	7	--

¹Data from 7 acute care hospitals were not included in analysis because the facilities had not completed their 2014 NHSN annual survey at the time of data download.

Table 3 displays the number of hospitals that report CLABSI data by all critical care locations and hospital type. Acute care general hospitals report CLABSI data for 90 out of the 94 CCU reporting locations. Of the 94 CCU locations that reported CLABSI data, 46 (49%) were medical/surgical critical care locations.

Hospital Type	Table 3. Number of Hospitals Reporting CLABSI by All Critical Care Unit (CCU) Locations												
	Cardiothoracic	Coronary	Long Term Acute Care	Medical	Medical/Surgical	Neurosurgical	Pediatric Cardiothoracic	Pediatric Medical	Pediatric Medical/Surgical	Prenatal	Surgical	Trauma	ALL CCU Locations

Table 5 displays the number of hospitals that report CLABSI data in neonatal intensive care unit (NICU) locations by NICU location and hospital type. Four general hospitals reported CLABSI data in level II/III NICU locations and five general hospitals reported CLABSI data in level III NICU locations.

Hospital Type	Table 5. Number of Hospitals Reporting CLABSI by NICU Type		
	NICU Level II/III	NICU Level III	All NICU Locations
	N	N	N
Acute Care (General)	4	5	9
Total (All Facilities)	4	5	9

Table 6 displays the number of hospitals that report CLABSI data in specialty care area (SCA) locations by SCA location and hospital type. Two general hospitals reported CLABSI data in bone marrow transplant units, 9 general hospitals reported CLABSI data in hematology/oncology units, 1 general hospital reported CLABSI in a leukemia/lymphoma unit and 3 general hospitals reported CLABSI data in pediatric hematology/oncology units.

Hospital Type	Table 6. Number of Hospitals Reporting CLABSI by SCA Type				
	Bone Marrow Transplant	Hematology/ Oncology	Leukemia/ Lymphoma	Pediatric Hematology/ Oncology	All SCA Locations
	N	N	N	N	N
Acute Care (General)	2	9	1	3	15
All Hospitals	2	9	1	3	15

Table 7 shows the number of hospitals who reported SSI data by reportable procedure type and hospital type. The majority of hospitals reporting SSI data for all reportable procedure types are acute care general hospitals. One acute care critical access hospital reported SSI data for HYST procedures and two acute care critical access hospitals reported SSI data for COLO, HPRO, and KPRO procedures. One surgical hospital and one women's and children's hospital in South Carolina both reported SSI data for all reportable procedures with the exception of GBGC and CBGB.

Hospital Type	Table 7. Number of Hospitals Reporting SSI by Procedure Type

Acute Care (Women's and Children's)	1	1	.	.	1	1
Total (All Hospitals)	52	57	14	17	57	54

CLABSI SIR Summary Data

Table 8 shows overall South Carolina CLABSI SIRs by the following location types: adult critical care unit (CCU), pediatric CCU, adult ward, pediatric ward, adult specialty care area (SCA), pediatric SCA, adult rehabilitation ward, neonatal intensive care units (NICU). The overall South Carolina CLABSI SIR is less than 1 and is statistically significant, indicating the CLABSI experience among South Carolina hospitals was better than the overall national baseline experience for the same location types.

Table 8. Overall South Carolina CLABSI SIR by Location Type						
Location Type	No. Central Line Days	No. Observed CLABSI	No. Expected CLABSI	SIR	95% Confidence Interval	Statistical Interpretation
Adult CCU	129217	121	246.87	0.49	0.41, 0.58	Lower
Pediatric CCU	7280	8	21.40	0.37	0.17, 0.71	Lower
Adult Ward	210358	137	299.24	0.46	0.39, 0.54	Lower
Pediatric Ward	6684	6	19.88	0.30	0.12, 0.63	Lower
Rehabilitation ¹	6367	1	5.09	0.20	0.01, 0.97	Lower
Adult SCA	36995	48	75.45	0.64	0.47, 0.84	Lower
Pediatric SCA	6423	12	16.85	0.71	0.39, 1.21	Not Different
NICU	18934	26	47.54	0.55	0.37, 0.79	Lower
All Location Types	422258	359	732.32	0.49	0.44, 0.54	Lower

¹National benchmark data used to calculate the SIR for rehabilitation ward locations within rehabilitation hospitals are currently unavailable. Therefore, SIR data for these ward locations are excluded from the data presented in the above table. The rehabilitation ward data shown in the table was reported from rehabilitation wards within acute care hospitals in South Carolina.

Table 9 displays overall South Carolina CLABSI SIRs by individual adult critical care unit (CCU) locations. Cardiothoracic, medical, medical/surgical, surgical, and trauma CCU locations have statistically significant SIRs that are less than 1, indicating the CLABSI experiences in these CCU locations were lower than the national baseline experiences in similar CCU locations. The SIR calculated for neurosurgical and coronary CCU locations is less than 1 but is not statistically significant, indicating that CLABSI experiences in South Carolina neurosurgical and coronary CCU locations were statistically not different than the national baseline experience in these locations.

Table 9. Overall South Carolina CLABSI SIR by Adult CCU Locations¹						
Adult CCU Location	No. Central Line Days	No. Observed CLABSI	No. Expected CLABSI	SIR	95% Confidence Interval	Statistical Interpretation
Cardiothoracic	18816	16	26.34	0.61	0.36, 0.96	Lower
Coronary	9843	13	19.69	0.66	0.37, 1.10	Not Different
Medical	23071	28	49.36	0.57	0.38, 0.80	Lower
Medical/Surgical	56058	43	89.29	0.48	0.35, 0.64	Lower
Neurosurgical	2834	3	7.09	0.42	0.11, 1.15	Not Different
Surgical	9106	9	20.94	0.43	0.21, 0.78	Lower
Trauma	9489	9	34.16	0.26	0.13, 0.48	Lower

¹National benchmark data used to calculate SIR data for prenatal and long term acute care CCU locations are currently unavailable. Therefore, SIR data for these CCU location types are not included in the above table.

Table 10 shows overall South Carolina CLABSI SIRs by individual pediatric CCU locations. South Carolina pediatric cardiothoracic CCU locations show a statistically significant SIR that is less than 1, indicating that the CLABSI experience in these locations is better than the national baseline experience in similar locations. South Carolina pediatric medical and pediatric medical/surgical CCU locations show a SIR that is less than 1, though the SIR is not statistically significant, indicating that the CLABSI experiences in these locations were not statistically different than the national baseline experience in pediatric medical and pediatric medical/surgical CCU locations.

Table 10. Overall South Carolina CLABSI SIR by All Pediatric CCU Locations						
Pediatric CCU Location	No. Central Line Days	No. Observed CLABSI	No. Expected CLABSI	SIR	95% Confidence Interval	Statistical Interpretation
Pediatric Cardiothoracic	3276	3	10.81	0.28	0.07, 0.75	Lower
Pediatric Medical	835	1	1.09	0.92	0.05, 4.54	Not Different
Pediatric Medical/Surgical	3169	4	9.51	0.42	0.13, 1.01	Not Different

Table 11 shows overall South Carolina CLABSI SIRs by individual adult ward locations. Adult medical, medical/surgical, step down, and surgical ward SIRs are less than 1 and are statistically significant, indicating a better CLABSI experience than the national baseline experience in these adult ward locations

Table 11. Overall South Carolina CLABSI SIRs by All Adult Ward Locations¹						
Adult Ward Location	No. Central Line Days	No. Observed CLABSI	No. Expected CLABSI	SIR	95% Confidence Interval	Statistical Interpretation
Gynecology	1001	0	1.10	0	0.00, 2.72	Not Different
Labor and Delivery	57	0	0	.	.	--
Labor and Delivery Post Partum	85	0	0	.	.	--
Medical	59035	56	88.55	0.63	0.48, 0.81	Lower

Neurosurgical	2680	2	2.41	0.83	0.14, 2.74	Not Different
Orthopedic	10875	5	8.70	0.57	0.21, 1.27	Not Different
Post Partum	169	0	0	.	.	--
Step Down	33606	17	70.57	0.24	0.15, 0.37	Lower
Surgical	28816	19	40.34	0.47	0.29, 0.72	Lower
Vascular	5202	3	5.72	0.52	0.13, 1.42	Not Different

¹National benchmark data used to calculate SIR data for antenatal, gastrointestinal, inpatient rehabilitation, long term acute care locations are currently unavailable. Therefore, SIR data for these ward locations are not included in the above table.

Table 12 shows overall South Carolina CLABSI SIRs by individual pediatric ward locations. The SIR shown for South Carolina pediatric medical ward locations was less than 1, however the SIR was not statistically significant indicating that the CLABSI experience in these locations was statistically not different than the national baseline experience for pediatric medical ward locations. The SIR shown for South Carolina pediatric medical/surgical ward locations is less than 1 and is statistically significant, indicating that the CLABSI experience in these locations was statistically better than the national baseline experience for pediatric medical/surgical ward locations

Table 12. Overall South Carolina CLABSI SIRs by All Pediatric Ward Locations						
Ward Location	No. Central Line Days	No. Observed CLABSI	No. Expected CLABSI	SIR	95% Confidence Interval	Statistical Interpretation
Pediatric Medical	650	0	1.17	0	0.00, 2.56	Not Different
Pediatric Medical/Surgical	6034	6	18.71	0.32	0.13, 0.66	Lower

¹National benchmark data used to calculate SIR data for pediatric orthopedic, pediatric step down ward locations are currently unavailable

Table 13 displays overall South Carolina CLABSI SIRs by adult SCA locations. South Carolina bone marrow transplant locations have a SIR greater than 1, but statistically it is not different from the national baseline CLABSI experience in bone marrow transplant locations. Hematology/oncology locations show a SIR that is less than 1 and statistically significant, indicating the CLABSI experience was better than the national baseline experience in hematology/oncology locations.

Table 13. Overall South Carolina CLABSI SIRs by All Adult SCA Locations¹						
Ward Location	No. Central Line Days	No. Observed CLABSI	No. Expected CLABSI	SIR	95% Confidence Interval	Statistical Interpretation
Bone Marrow Transplant	1917	7	6.91	1.01	0.44, 2.00	Not Different
Hematology/Oncology	35078	41	68.54	0.60	0.44, 0.80	Lower

¹National benchmark data used to calculate SIR data for leukemia/lymphoma specialty care area locations are not currently available. Therefore, SIR data for these location types are not included in the above table.

Table 14 shows overall South Carolina CLABSI SIRs by NICU locations. The SIR shown for South Carolina level II/III NICU locations was less than 1, however, the SIR was not statistically significant indicating that the CLABSI experience in these locations was statistically not different than the national baseline experience for level II/III NICU locations. The SIR shown for South Carolina level III NICU locations is less than 1 and is statistically significant, indicating that the CLABSI experience in these locations was statistically better than the national baseline experience for level III NICU locations.

Table 14. Overall South Carolina CLABSI by NICU Locations						
Ward Location Type	No. Central Line Days	No. Observed CLABSI	No. Expected CLABSI	SIR	95% Confidence Interval	Statistical Interpretation
NICU Level II/III	1568	2	3.57	0.56	0.09, 1.85	Not Different
NICU Level III	17366	24	43.97	0.55	0.36, 0.80	Lower

Table 15 shows identified microorganisms for all reported CLABSI in all adult and pediatric inpatient locations. Coagulase negative *Staphylococcus species* represent 17.7 % of the total isolates reported for CLABSI in all adult and pediatric inpatient locations and make up the largest percentage of identified microorganisms.

Table 15. Identified Microorganisms for All Reported CLABSI in All Adult and Pediatric Inpatient Locations		
Microorganisms	Number of Isolates	Percentage (%) of Total Isolates
Coagulase negative <i>Staphylococcus species</i>	76	17.7%
<i>Candida species</i> and other yeasts	69	16.1%
<i>Enterococcus species</i> (includes Vancomycin resistant <i>Enterococcus</i> (VRE)isolates)	62	14.4%
VRE only	23	(5.4%)
<i>Staphylococcus aureus</i> (includes Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) isolates)	60	14.0%
MRSA only	32	(7.4%)
<i>Klebsiella species</i>	36	8.4%
<i>Escherichia coli</i>	27	6.3%
<i>Streptococcus species</i>	19	4.4%
<i>Enterobacter species</i>	18	4.2%
<i>Serratia species</i>	11	2.5%
<i>Bacteroides species</i> and other anaerobes	11	2.5%
<i>Pseudomonas species</i>	11	2.5%
<i>Proteus species</i>	4	1.0%
<i>Stenotrophomonas species</i>	3	0.7%
<i>Morganella species</i>	2	0.5%
<i>Mycobacterium species</i>	2	0.5%
<i>Rothia species</i>	2	0.5%
<i>Citrobacter species</i>	2	0.5%
<i>Burkholderia species</i>	2	0.5%
Other pathogens	12	2.8%
Total Pathogens	429	100%

Table 16 shows identified microorganisms for all reported CLABSI in NICU locations. *Staphylococcus aureus* (includes Methicillin-resistant *Staphylococcus aureus* (MRSA)) represent 32.1% of the total isolates reported for NICU CLABSIs and make up the largest percentage of identified microorganisms.

Table 16. Identified Microorganisms for All Reported CLABSI in NICU Locations		
Microorganisms	Number of Isolates	Percentage (%) of Total Isolates
<i>Staphylococcus aureus</i> (includes Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) isolates)	9	32.1%
MRSA only	3	(10.7%)
Coagulase negative <i>Staphylococcus species</i>	5	17.9%
<i>Escherichia coli</i>	4	14.3%
<i>Serratia species</i>	3	10.7%
<i>Enterococcus species</i> (includes Vancomycin resistant <i>Enterococcus</i> (VRE)isolates)	2	7.1%
VRE only	0	(0.0%)
<i>Candida species</i>	2	7.1%
<i>Klebsiella species</i>	1	3.6%
<i>Citrobacter species</i>	1	3.6%
<i>Burkholderia species</i>	1	3.6%
Total Pathogens	28	100%

Table 17 shows identified microorganisms for all reported CLABSI in LTAC locations. *Enterococcus species* (includes Vancomycin-resistant *Enterococcus* (VRE)) represent 44.0% of the total isolates reported for CLABSIs in LTAC locations and make up the largest percentage of identified microorganisms.

Table 17. Identified Microorganisms for All Reported CLABSI in LTAC Locations		
Microorganisms	Number of Isolates	Percentage (%) of Total Isolates
<i>Enterococcus species</i> (includes Vancomycin-resistant <i>Enterococcus</i>(VRE) isolates)	11	44.0%
VRE only	4	(16.0%)
Coagulase negative <i>Staphylococcus species</i>	5	20.0%
<i>Staphylococcus aureus</i> (includes Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) isolates)	0	0.0%
MRSA only	0	(0.0%)
<i>Enterobacter species</i>	3	12.0%
<i>Candida species</i> and other yeasts	2	8.0%
<i>Proteus species</i>	1	4.0%
<i>Pseudomonas species</i>	1	4.0%
<i>Serratia species</i>	1	4.0%
<i>Klebsiella species</i>	1	4.0%
TOTAL Pathogens	25	100%

SSI SIR Summary Data

Table 18 shows overall South Carolina SSI complex AR SIRs by reportable procedure type. CBGC and KPRO procedures show statistically significant SIRs that are less than 1, indicating the SSI experience for these procedure types was statistically better than the national baseline SSI experience. The overall SSI SIR for all procedure types is not statistically significant; indicating the SSI experience in South Carolina is not different from the SSI experience in the national baseline population.

Procedure Type	No. Performed Procedures	No. Observed SSI	No. Expected SSI	SIR	95% Confidence Interval	Statistical Interpretation
CBGB	3457	33	42.16	0.78	0.55, 1.09	Not Different
CBGC	264	0	3.30	0.00	0.00, 0.91	Lower
COLO	4771	160	145.20	1.10	0.94, 1.28	Not Different
HPRO	7576	76	68.23	1.11	0.88, 1.39	Not Different
HYST	5777	46	44.49	1.03	0.77, 1.37	Not Different
KPRO	11420	36	69.13	0.52	0.37, 0.71	Lower
All Procedures	33265	351	372.51	0.94	0.85, 1.05	Not Different

¹The complex AR SIR includes only inpatient procedures and deep incision primary and organ/space SSIs that were identified during admission or readmission to the procedure performing facility.

SSI Positive Culture and Positive MRSA Culture Data SSI

Table 19 shows positive culture and positive MRSA culture results for SSIs by procedure type. The percentage of MRSA positive culture results for all reportable procedure types ranged from 0.0% to 18.0%.

Procedure Type	No. Observed SSI¹	No. Observed SSI with Positive Culture Results	No. Observed SSI with Positive MRSA Culture Results	% MRSA of Positive Culture Results
CBGB	62	55	7	12.7%
CBGC	1	1	0	0.0%
COLO	276	164	17	10.4%
HPRO	108	100	18	18.0%
HYST	81	39	4	10.2%
KPRO	65	56	7	12.5%
All Procedures	593	415	53	12.8%

¹Includes all reported SSIs regardless of surgical wound class.

Hospital Onset MRSA BSI LabID Event Summary Data

Table 20 shows the overall South Carolina hospital onset (HO) MRSA BSI LabID event SIR for acute care hospitals. A total of 170 hospital HO MRSA BSI LabID events were reported from acute care hospitals in 2014. The overall South Carolina HO MRSA BSI LabID event SIR for acute care hospitals was not statistically significant, indicating the HO MRSA BSI experience in South Carolina was not different than the HO MRSA BSI experience in the national baseline population.

Table 20. Overall South Carolina HO MRSA BSI LabID Event SIR for Acute Care Hospitals¹					
No. of Observed HO MRSA LabID Events	No. Patient Days	No. Expected HO MRSA BSI LabID Events	SIR	95% Confidence Interval	Statistical Interpretation
171	2500422	173.07	0.99	0.85, 1.15	Not Different

¹National benchmark data used to calculate SIR data for LTAC and IRF hospitals are not currently available. Therefore, SIR data for these types of hospitals are excluded from the overall South Carolina HO MRSA BSI LabID event SIR data presented in the above table

Conclusions

South Carolina's implementation of HIDA provides consumers and public health officials with transparent access to statewide and facility specific HAI data, supporting the prevention of HAIs and the promotion of better infection control practices across the state.

South Carolina continues to make strides in CLABSI prevention. The 2013 Department of Health and Human Services (DHHS) National Action Plan's prevention target for CLABSI prevention was a 50% reduction compared to national baseline data. By 2014 South Carolina's CLABSI SIR was 51% below national baseline data. The 2013 DHHS National Action Plan's prevention target for SSI was a 25% reduction compared to national baseline data. South Carolina showed a 6% reduction in SSI and a 1% reduction in MRSA compared to national baseline data falling short of the DHHS National Action Plan's prevention target of a 25% reduction for each metric (See Table 21 below).

New DHHS National Action Plan's prevention targets will be created in 2015 and will utilize 2015 data to establish new national baseline data. Thus the SIRs will be generated by comparison to the new baseline data. Continued HAI surveillance, data publication and partnership with HAI prevention stakeholders is needed to ensure ongoing HAI data transparency and improved patient safety in South Carolina.

Table 21: South Carolina SIRs compared to DHHS National Action Plan's prevention targets and national 2013 data (2013 is the most recent national data available).

HAI Metric	Target SIR	South Carolina 2014 SIR	US 2013 SIR
CLABSI	0.50	0.49	0.54
SSI	0.75	0.94	0.81
MRSA HO LabID Events	0.75	0.99	0.92

Hospital Infections Disclosure Act (HIDA)
Advisory Committee Members

Hospital Infection Disclosure Act Advisory Committee Members (as of April 2015)

Name	Title, Organization
Aunyika Moonan, PhD, MSPH, CPHQ	Director of Quality Measurement Services, South Carolina Hospital Association
Bob Rife, BS, RRT	Manager of Pulmonary Services, Roper St. Francis Healthcare
Cassandra Salgado, MD	Infectious Disease Physician, Medical University of South Carolina
Dana Giurgiutiu, PhD, MPH	Director, Division of Acute Disease Epidemiology, DHEC
Francee Levin, BA	Executive Council Member, AARP
Helen Haskell	Founder, Mothers Against Medical Error
Helmut Albrect, MD	Infectious Disease Physician, Palmetto Richland/University of South Carolina School of Medicine
Jan Lienau, BSN, RN, CIC	Infection Preventionist, Greer Memorial Hospital, APIC Palmetto Representative
Jennifer Meredith, PhD, HCLD	Clinical Microbiology Director, Greenville Health System
Jon Ruoff, PhD	Founder, The Ruoff Group
Julie Royer, MSPH	Statistician, The Office of Research and Statistics
Kathy Bryant, RN, CIC	Infection Preventionist, Spartanburg Regional Healthcare, APIC Palmetto Representative
Kathy Ward, RN, BSN, MPH, CIC	Infection Preventionist, Roper St. Francis Hospital, APIC Palmetto Representative
Kevin Shea, MD	Infectious Disease Physician, Carolinas Healthcare System
Lorri Gibbons, RN, BSN, CPHQ	Vice President for Quality Improvement and Patient Safety, South Carolina Hospital Association
Lynn Page, BSN, RN	Care Improvement Specialist, The Carolinas Centers for Medical Excellence
Matthew Crist, MD, MPH	Medical Consultant/Healthcare-associated Infections Section Director, Division of Acute Disease Epidemiology, DHEC
Richard Foster, MD	Senior Vice President for Quality Improvement and Patient Safety, South Carolina Hospital Association
Stanley Ostrawki, RN, MS, MT(ASCP),CIC	Infection Preventionist, Division of Acute Disease Epidemiology, DHEC
Virginia Herring, BSN, RN, CIC	Infection Preventionist, Palmetto Richland Hospital, APIC Palmetto Representative

Appendix B.
2014 Attestation Letter Template

Date: _____

Facility: _____

Dear Infection Preventionist,

To ensure the accuracy and timeliness of individual HIDA facility reports, and to allow for a more concrete way to evaluate the quality and accuracy of hospital information reported under SC Code of Laws Section 44-7-2410 et seq., infection preventionists must sign below, affirming they have reviewed and made corrections, if needed, to their facility's 2014 HIDA Annual Report.

If a facility does not submit a signed version of this letter by Friday, March 13, 2015, the facility's report will be posted on the SC DHEC's HIDA webpage, and marked with an asterisk to note that the facility failed to confirm the accuracy of their report prior to the publish date. The intent of this statement is to ensure facilities are accountable for their data in a timely fashion and to avoid any unnecessary delays caused by last minute change requests.

STATEMENT OF REVIEW AND CORRECTION:

To the best of my knowledge, my facility's preliminary HIDA report, containing central line associated blood stream infection data, surgical site infection data and facility information data, is accurate. Errors that may have been identified during the review process have been corrected within the National Healthcare Safety Network.

Infection Preventionist Name (Printed): _____

Infection Preventionist Signature: _____

Please copy this letter on facility letterhead and email/fax a signed form to Matthew Crist, by Friday, March 13, 2015.

Email: cristmb@dhec.sc.gov

Fax: (803) 898 - 0897

Appendix C.
Facility Specific Rate Data Reports for CLABSI, SSI
and Hospital Onset MRSA BSI LabID Events

Abbeville Area Medical Center

Hospital Infections Disclosure Act Report

Reported by: South Carolina Department of Health and Environmental Control

Surgical Site Infection (SSI) Rate by Procedure and Risk Index

Data Collected: 01/01/2014 - 12/31/2014

Procedure	Risk Category ^{a,b,c}	No. of Infections	No. of Specific Procedures Performed ^d	Infection Rate (per 100 Procedures)
Hip Prosthesis (Replacement)	1	*	2	*
	2,3	*	1	*
Knee Prosthesis (Replacement)	0	*	19	*
	1	*	12	*
	2,3	*	5	*
Colon Surgery	0	*	8	*
	1	*	1	*
	2	*	8	*
	3	*	1	*

a. Basic SSI Risk Index: NHSN assigns surgical patients into risk categories based on the presence of one or more of three major risk factors. For further explanation see [Definition of Terms](#).

b. If there is more than one risk category in a row (e.g., 2, 3), it means that the risk of infection between the individual categories was not different statistically, so the data from those categories shown were combined.

c. If you do not see a risk category, it means that no surgeries were performed for that particular risk category.

d. *= Too few procedures. Reporting on too few procedures is a risk to patient confidentiality and data stability. If less than twenty surgical procedures are performed, the rate and number of infections will be suppressed until more procedures are performed.

Abbeville Area Medical Center

Central Line Associated Blood Stream Infection (CLABSI) Rate

Data Collected: 01/01/2014 - 12/31/2014

Location ^a	No. of Infections	No. of Central Line Days ^{b,c}	Infection Rate (per 1000 Central Line Days)
All Adult Critical Care Units	*	33	*
All Adult Inpatient Wards	0	192	0.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All adult and pediatric critical care units (except NICUs) are combined into one rate; all adult and pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

Abbeville Area Medical Center

Methicillin-resistant Staphylococcus aureus bloodstream infection (MRSA BSI) LabID Event Data

Facility Wide Inpatient Data Collected: 01/01/2014 - 12/31/2014

Hospital Onset MRSA BSI LabID Event Data		
No. Patient Days	No. Hospital Onset MRSA BSI LabID Events ^a	MRSA BSI Incidence Density Rate per 1000 Patient Days ^b
2851	0	0.000

a. Hospital Onset: LabID event specimen collected as an inpatient >3 days after admission to the facility (i.e., on or after day 4)

b. MRSA BSI Infection Incidence Density Rate = (No. of Hospital Onset MRSA BSI LabID events/ No. of patient days of the facility) x 1000

Aiken Regional Medical Center

Hospital Infections Disclosure Act Report

Reported by: South Carolina Department of Health and Environmental Control

Surgical Site Infection (SSI) Rate by Procedure and Risk Index

Data Collected: 01/01/2014 - 12/31/2014

Procedure	Risk Category ^{a,b,c}	No. of Infections	No. of Specific Procedures Performed ^d	Infection Rate (per 100 Procedures)
Coronary Bypass Graft (Chest and Donor Incision)	1	*	11	*
	2	*	12	*
Coronary Bypass Graft (Chest Only Incision)	0,1	*	1	*
	2,3	*	1	*
Abdominal Hysterectomy	0	0	54	0.00
	1	0	40	0.00
	2,3	*	6	*
Hip Prosthesis (Replacement)	0	0	24	0.00
	1	2	70	2.86
	2,3	1	28	3.57
Knee Prosthesis (Replacement)	0	0	23	0.00
	1	1	64	1.56
	2,3	0	25	0.00
Colon Surgery	0	*	18	*
	1	1	68	1.47
	2	1	25	4.00
	3	*	5	*

a. Basic SSI Risk Index: NHSN assigns surgical patients into risk categories based on the presence of one or more of three major risk factors. For further explanation see [Definition of Terms](#).

b. If there is more than one risk category in a row (e.g., 2, 3), it means that the risk of infection between the individual categories was not different statistically, so the data from those categories shown were combined.

c. If you do not see a risk category, it means that no surgeries were performed for that particular risk category.

d. *= Too few procedures. Reporting on too few procedures is a risk to patient confidentiality and data stability. If less than twenty surgical procedures are performed, the rate and number of infections will be suppressed until more procedures are performed.

Aiken Regional Medical Center

Central Line Associated Blood Stream Infection (CLABSI) Rate

Data Collected: 01/01/2014 - 12/31/2014

Location^a	No. of Infections	No. of Central Line Days^{b,c}	Infection Rate (per 1000 Central Line Days)
All Adult Critical Care Units	4	2767	1.4
All Adult Inpatient Wards	0	2650	0.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All adult and pediatric critical care units (except NICUs) are combined into one rate; all adult and pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

All Adult Critical Care Units	*	22	*
All Adult Inpatient Wards	0	59	0.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All adult and pediatric critical care units (except NICUs) are combined into one rate; all adult and pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

Surgical Site Infection (SSI) Rate by Procedure and Risk Index

Data Collected: 01/01/2014 - 12/31/2014

Procedure	Risk Category ^{a,b,c}	No. of Infections	No. of Specific Procedures Performed ^d	Infection Rate (per 100 Procedures)
Coronary Bypass Graft (Chest and Donor Incision)	1	1	244	0.41
	2	3	115	2.61
	3	*	1	*
Coronary Bypass Graft (Chest Only Incision)	0,1	*	5	*
	2,3	*	1	*
Abdominal Hysterectomy	0	1	42	2.38
	1	2	23	8.70
	2,3	*	5	*
Hip Prosthesis (Replacement)	0	0	58	0.00
	1	1	172	0.58
	2,3	1	33	3.03
Knee Prosthesis (Replacement)	0	0	91	0.00
	1	4	235	1.70
	2,3	1	36	2.78
Colon Surgery	0	5	22	22.73
	1	11	73	15.07
	2	6	51	11.76
	3	*	12	*

a. Basic SSI Risk Index: NHSN assigns surgical patients into risk categories based on the presence of one or more of three major risk factors. For further explanation see [Definition of Terms](#).

b. If there is more than one risk category in a row (e.g., 2, 3), it means that the risk of infection between the individual categories was not different statistically, so the data from those categories shown were combined.

c. If you do not see a risk category, it means that no surgeries were performed for that particular risk category.

d. *= Too few procedures. Reporting on too few procedures is a risk to patient confidentiality and data stability. If less than twenty surgical procedures are performed, the rate and number of infections will be suppressed until more procedures are performed.

Grand Strand Regional Medical Center

Central Line Associated Blood Stream Infection (CLABSI) Rate

Data Collected: 01/01/2014 - 12/31/2014

Location ^a	No. of Infections	No. of Central Line Days ^{b,c}	Infection Rate (per 1000 Central Line Days)
All Adult Critical Care Units	8	6940	1.2
All Adult Inpatient Wards	13	9049	1.4
All Pediatric Inpatient Wards	0	50	0.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All adult and pediatric critical care units (except NICUs) are combined into one rate; all adult and pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

All Adult Inpatient Wards	0	2051	0.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All adult and pediatric critical care units (except NICUs) are combined into one rate; all adult and pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

Central Line Associated Blood Stream Infection (CLABSI) Rate

Data Collected: 01/01/2014 - 12/31/2014

Location^a	No. of Infections	No. of Central Line Days^{b,c}	Infection Rate (per 1000 Central Line Days)
All Adult Inpatient Wards	1	1019	1.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All critical care units (except NICUs) are combined into one rate; all adult inpatient wards and all pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

	2,3	*	12	*
Colon Surgery	0	7	88	7.95
	1	6	119	5.04
	2	7	42	16.67
	3	*	8	*

a. Basic SSI Risk Index: NHSN assigns surgical patients into risk categories based on the presence of one or more of three major risk factors. For further explanation see [Definition of Terms](#).

b. If there is more than one risk category in a row (e.g., 2, 3), it means that the risk of infection between the individual categories was not different statistically, so the data from those categories shown were combined.

c. If you do not see a risk category, it means that no surgeries were performed for that particular risk category.

d. *= Too few procedures. Reporting on too few procedures is a risk to patient confidentiality and data stability. If less than twenty surgical procedures are performed, the rate and number of infections will be suppressed until more procedures are performed.

Palmetto Health Baptist

Central Line Associated Blood Stream Infection (CLABSI) Rate

Data Collected: 01/01/2014 - 12/31/2014

Location ^a	No. of Infections	No. of Central Line Days ^{b,c}	Infection Rate (per 1000 Central Line Days)
All Adult Critical Care Units	1	2609	0.4
All Adult Inpatient Wards	0	9896	0.0
Inpatient Rehabilitation Ward	*	11	*
Adult Hematology/Oncology Ward - Temporary Central Line	0	2509	0.0
Adult Hematology/Oncology Ward - Permanent Central Line	2	1721	1.2
Level II/III Neonatal Intensive Care Unit	1	954	1.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All adult and pediatric critical care units (except NICUs) are combined into one rate; all adult and pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

Central Line Associated Blood Stream Infection (CLABSI) Rate

Data Collected: 01/01/2014 - 12/31/2014

Location ^a	No. of Infections	No. of Central Line Days ^{b,c}	Infection Rate (per 1000 Central Line Days)
All Adult Critical Care Units	1	3096	0.3
All Adult Inpatient Wards	3	5490	0.5
Inpatient Rehabilitation Ward	0	178	0.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All adult and pediatric critical care units (except NICUs) are combined into one rate; all adult and pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

Regional Medical Center of Orangeburg and Calhoun Counties

Surgical Site Infection (SSI) Rate by Procedure and Risk Index

Data Collected: 01/01/2014 - 12/31/2014

Procedure	Risk Category ^{a,b,c}	No. of Infections	No. of Specific Procedures Performed ^d	Infection Rate (per 100 Procedures)
Coronary Bypass Graft (Chest and Donor Incision)	0	*	1	*
	1	3	217	1.38
	2	2	89	2.25
Coronary Bypass Graft (Chest Only Incision)	0,1	*	4	*
	2,3	*	5	*
Abdominal Hysterectomy	0	0	115	0.00
	1	0	76	0.00
	2,3	1	33	3.03
Hip Prosthesis (Replacement)	0	0	295	0.00
	1	3	212	1.42
	2,3	1	25	4.00
Knee Prosthesis (Replacement)	0	2	545	0.37
	1	1	346	0.29
	2,3	0	24	0.00
Colon Surgery	0	2	130	1.54
	1	8	163	4.91
	2	9	74	12.16
	3	*	6	*

a. Basic SSI Risk Index: NHSN assigns surgical patients into risk categories based on the presence of one or more of three major risk factors. For further explanation see [Definition of Terms](#).

b. If there is more than one risk category in a row (e.g., 2, 3), it means that the risk of infection between the individual categories was not different statistically, so the data from those categories shown were combined.

c. If you do not see a risk category, it means that no surgeries were performed for that particular risk category.

d. *= Too few procedures. Reporting on too few procedures is a risk to patient confidentiality and data stability. If less than twenty surgical procedures are performed, the rate and number of infections will be suppressed until more procedures are performed.

Hospital Infections Disclosure Act Report

Reported by: South Carolina Department of Health and Environmental Control

Surgical Site Infection (SSI) Rate by Procedure and Risk Index

Data Collected: 01/01/2014 - 12/31/2014

Procedure	Risk Category ^{a,b,c}	No. of Infections	No. of Specific Procedures Performed ^d	Infection Rate (per 100 Procedures)
Abdominal Hysterectomy	0	2	293	0.68
	1	1	94	1.06
	2,3	*	8	*
Hip Prosthesis (Replacement)	0	0	263	0.00
	1	2	246	0.81
	2,3	*	10	*
Knee Prosthesis (Replacement)	0	0	535	0.00
	1	4	670	0.60
	2,3	0	43	0.00
Colon Surgery	0	*	15	*
	1	1	24	4.17
	2	*	11	*
	3	*	3	*

a. Basic SSI Risk Index: NHSN assigns surgical patients into risk categories based on the presence of one or more of three major risk factors. For further explanation see [Definition of Terms](#).

b. If there is more than one risk category in a row (e.g., 2, 3), it means that the risk of infection between the individual categories was not different statistically, so the data from those categories shown were combined.

c. If you do not see a risk category, it means that no surgeries were performed for that particular risk category.

d. *= Too few procedures. Reporting on too few procedures is a risk to patient confidentiality and data stability. If less than twenty surgical procedures are performed, the rate and number of infections will be suppressed until more procedures are performed.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

Wallace Thomson Hospital

Methicillin-resistant Staphylococcus aureus bloodstream infection (MRSA BSI) LabID Event Data

Facility Wide Inpatient Data Collected: 01/01/2014 - 12/31/2014

Hospital Onset MRSA BSI LabID Event Data		
No. Patient Days	No. Hospital Onset MRSA BSI LabID Events ^a	MRSA BSI Incidence Density Rate per 1000 Patient Days ^b
6593	0	0.000

a. Hospital Onset: LabID event specimen collected as an inpatient >3 days after admission to the facility (i.e., on or after day 4)

b. MRSA BSI Infection Incidence Density Rate = (No. of Hospital Onset MRSA BSI LabID events/ No. of patient days of the facility) x 1000

Williamsburg Regional Hospital

Hospital Infections Disclosure Act Report

Reported by: South Carolina Department of Health and Environmental Control

Surgical Site Infection (SSI) Rate by Procedure and Risk Index

Data Collected: 01/01/2014 - 12/31/2014

Procedure	Risk Category ^{a,b,c}	No. of Infections	No. of Specific Procedures Performed ^d	Infection Rate (per 100 Procedures)
Abdominal Hysterectomy	0	*	2	*
	1	*	2	*
	2,3	*	1	*
Colon Surgery	1	*	1	*
	2	*	1	*

a. Basic SSI Risk Index: NHSN assigns surgical patients into risk categories based on the presence of one or more of three major risk factors. For further explanation see [Definition of Terms](#).

b. If there is more than one risk category in a row (e.g., 2, 3), it means that the risk of infection between the individual categories was not different statistically, so the data from those categories shown were combined.

c. If you do not see a risk category, it means that no surgeries were performed for that particular risk category.

d. *= Too few procedures. Reporting on too few procedures is a risk to patient confidentiality and data stability. If less than twenty surgical procedures are performed, the rate and number of infections will be suppressed until more procedures are performed.

Williamsburg Regional Hospital

Central Line Associated Blood Stream Infection (CLABSI) Rate

Data Collected: 01/01/2014 - 12/31/2014

Location ^a	No. of Infections	No. of Central Line Days ^{b,c}	Infection Rate (per 1000 Central Line Days)
All Adult Critical Care Units	0	159	0.0
All Adult Inpatient Wards	0	173	0.0

a. The specific patient care area in which a patient is assigned while receiving care in the healthcare facility. All adult and pediatric critical care units (except NICUs) are combined into one rate; all adult and pediatric inpatient wards are combined into one rate for this report.

b. Central line days are the total number of days a central line is in place for all patients in selected hospital locations.

A central line day calculation example can be found in the [Definitions of Terms](#).

c. * = Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are less than fifty central lined days, the rate and number of infections will be suppressed until there are more central line days to report.

Williamsburg Regional Hospital

Methicillin-resistant Staphylococcus aureus bloodstream infection (MRSA BSI) LabID Event Data

Facility Wide Inpatient Data Collected: 01/01/2014 - 12/31/2014

Hospital Onset MRSA BSI LabID Event Data		
No. Patient Days	No. Hospital Onset MRSA BSI LabID Events ^a	MRSA BSI Incidence Density Rate per 1000 Patient Days ^b
5803	0	0.000

a. Hospital Onset: LabID event specimen collected as an inpatient >3 days after admission to the facility (i.e., on or after day 4)

b. MRSA BSI Infection Incidence Density Rate = (No. of Hospital Onset MRSA BSI LabID events/ No. of patient days of the facility) x 1000

a. *= Too few central line days. Reporting on too few central line days is a risk to confidentiality and data stability. If there are fewer than fifty central line days, the SIR and number of infections will be suppressed until there are more central line days to report.

b. Please note that the 'expected' number of infections does not mean that you expect to get an infection when you go into the hospital for surgery. The goal is for the hospital is to prevent all HAIs.

c. SC Hospital SIR Statistical Interpretation Comparison to the standard population means that the SIR is compared to one (1) where the observed equals the expected (Observed = Expected)

o Not different = Statistically not different than the standard population o

Lower = Statistically lower than the standard population

o Higher = Statistically higher than the standard population

a.*= Too few procedures. Reporting on too few procedures is a risk to patient confidentiality and data stability. If less than twenty surgical procedures are performed, the SIR and number of infections will be suppressed until more procedures are performed.

b. Please note that the 'expected' number of infections does not mean that you expect to get an infection when you go into the hospital for surgery. The goal is for the hospital is to prevent all HAIs.

c. SC Hospital SIR Statistical Interpretation Comparison to the standard population means that the SIR is compared to one (1) where the observed equals the expected (Observed = Expected)

o Not different = Statistically not different than the standard population o

Lower = Statistically lower than the standard population

o Higher = Statistically higher than the standard population

a. Please note that the 'expected' number of infections does not mean that you expect to get an infection when you go into the hospital for surgery.

The goal is for the hospital is to prevent all HAIs.

b. SC Hospital SIR Statistical Interpretation Comparison to the standard population means that the SIR is compared to one (1) where the observed equals the expected (Observed = Expected)

o Not different = Statistically not different than the standard population o

Lower = Statistically lower than the standard population

o Higher = Statistically higher than the standard population
